                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The ANT1 polynucleotide can be used for modifying the expression of a native plant gene, particularly for producing an anthocyanin 1 phenotype in plants, which is responsible for many red and blue colours in plants. The polynucleotide is useful for modifying e.g. leaf colour, flower
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotide derived from tomato, useful for producing an Anthocyanin 1 phenotype in plants, particularly for modifying e.g. leaf color, flower color or fruit color in plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 2; Page 39; 53pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes tomato anthocyanin 1 (ANT1). The ANT1 polynucleotide can be used for modifying the expression of a native plant gene, particularly for producing an anthocyanin 1 phenotype in plants, which is responsible for many red and blue colours in plants. The present sequence represents an anticular of the polynucleotide is useful for modifying e.g. leaf colour, flower colour or fruit colour in plants. The present sequence represents an ANT1 genomic DNA fragment which is used in an example from the present and the present sequence represents the present seque
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide derived from tomato, useful an Anthocyanin 1 phenotype in plants, particularly for leaf color, flower color or fruit color in plants -

                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                         The present cDNA sequence is homologue G2421 of Arabidopsis thaliana transcription factor G663. The transcription factors may be used to modify traits associated with structural or developmental characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify the to alter seed characteristics such as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination transcription factor levels in plants offers great potential in garicultural biotechnology for modifying a plant's traits.
                                                                                                                                                                                                                                                                               Matches

                            encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a plant ha

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    encodes a polypeptide or an antisense nucleic acid, inserting the polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 polynucleotides encoding an A. thaliana transcription factor.

                                                                                                                                                                                                                                                                                                                      The invention relates to an Arabidopsis thaliana nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions CC comprising a sequence selected from any one of 99 sequences (ABN98231-ABN99231), CC given in the specification or its fragment. A polypeptide (II) encoded by (I), a transgenic plant (III) comprising an exogenous nucleic acid or a CC genetically modified cell (IV) comprising an exogenous nucleic acid, is CC useful in identifying homologous or related genes, in producing CC compositions that modulate the expression or function of its encoded CC protein, mapping functional regions of the protein and in studying a saociated physiological pathways. (I) is also useful for the genetic CC manipulation of cells, particularly plant cells. (I) is also useful in CC screening assays of various plant strains to determine the strains that CC are best capable of withstanding a particular disease or environmental CC stress. (II) and (III) are useful for screening of biologically active agents, e.g. fungicides, insecticides, etc., for elucidating biochemical cc pathways. The screened agents are useful in improved methods of treating crops to prevent or treat disease. (II) are also useful in screening CC programs to identify agents that mimic or enhance the action of tolerance for enhance their tolerance to environmental stress. (I) is also useful for comparance to inhibiting production of a biosynthetic product in a CC expression of proteins of interest, for establishing the extent to which capacitic insect and/or pathogen is responsible for damage to a particular plant, for identifying other mediators that enhance or induce tolerance to environmental stress, for identifying factors involved in biosynthetic productions of nutritional, commercial or medicinal value and cc particular plant, for of of the protein of the expression of puritional, commercial or medicinal value and concerning or inductions of nutritional.
                                                                             Matches
                                                                                           Query Match

                                                                                                                                                                                       for identifying productions of nutritional, commercial or medicinal value. (IV) is useful in the study of genetic function and regulation, for alteration of the cellular metabolism and for screening compounds that may affect the biological function of the gene or gene products. Note: The sequence data for this patent did not form part of the print specification, but was obtained in electronic format directly from USP at seqdata.uspto.gov/sequence.html?DocID=999909770445.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Arabidopsis thaliana nucleic acid for identifying homologous genes, producing compositions that modulate the expression or function of its

The transcription factors may be used to modify traits associate with structural or developmental characteristics of plants, cor potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, to modify vitamin and mineral content, to modif the oil content of seeds, to modify the insoluble sugar content of seeds, to modify phrenyl lipid content, to modify fatty acid and modifications.

They may also be used to alter seed characteristics such as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination rate. They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
               This invention relates to the nucleotide and protein sequences of novel Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 or PAP2. The genes for both PAP1 and PAP2 have been mapped to chromosomus 1. PAP1 and PAP2 are WYB-like transcription factors that regulate the production of anthocyanin pigment. The nucleotide sequence of the invention is useful for screening for PAP gene expression, it is also useful for detecting promoter activity within a plant cell. The nucleotide sequence is also useful for screening for plant cell (e.g., A. thaliana) transformation. The transformed plant cells are then used to produce transgenic plants with tissue-specific altered colour
                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated PAP1 or PAP2 gene, useful for increasing pigmentation in plants, as reporter genes for analysing expression pattern of promoter of interest, and to increase flux through phenylpropanoid pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-JUN-2000; 2000US-0603244.

PAP1 or PAP2 overexpression can also be useful in developing or enhancing desirable colouration in ornamental plants for commercial sales, and for sensitising plants to stress. Introduction of PAP1 or PAP2 sensitises
                                                                                                                                                                                                                                                                                                                                                                                                          alkaloid pathway gene; taxadiene synthase; biological pathway; free: abiotic stress; cold; drought; heat; nutrient deficiency; biotic stinfection; developmental pathway; flowering; root development; TDS; transgenic; transgenic plant; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1033 BP; 334 A; 161 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plants to respond more quickly to a stress condition in ways that are physiologically significant, as well as in ways of ornamental significance. The present sequence represents the A. thaliana PAP2 cD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes a plant stress tolerance-related myloblastosis (MYB) transcription factor. The specification describes AtMYB60, AtMYB764, AtMYB75 and AtMYB60 MYB polypeptides are useful for enhancing a plant's tolerance or sensitivity to stress e.g. salt, drought, cold and heat tolerance. It is also useful for producing a transgenic plant with enhanced stress tolerance or stress sensitivity. MYB polypeptides are also useful for increasing the production of products of the phenylpropanoid biosynthesis pathway, e.g. stilbenes, flavonoids, lignins, salicylic acid, anthocyanins, and phenolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecules encoding plant stress tolerance-related myloblastosis transcription factors for increasing stress resistance a crop in a field -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
The present cDNA sequence is homologue G2422 of Arabidopsis thaliana transcription factor G663. The transcription factors may be used to modify traits associated with structural or developmental characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify the insoluble sugar content of seeds, to modify the plants acid and modify wax content. They may alipid content, to modify fatty acid and modify wax content. They may alipid content seed characteristics such as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination
                                                                                                                                                                              Nucleic acids encoding plant transcription factor polypeptides, to for altering the developmental and structural characteristics of plants, e.g. corn, potato and cotton plants -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        rate. They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC encoding an Arabidopsis thaliana transcription factor, their variants, CC complements, fragments, or related polynucleotide with 31% to 95% CC sequence identity, where the plant polynucleotide with 31% to 95% CC sequence identity, where the plant polynucleotide with 31% to 95% CC sequence identity, where the plant polynucleotide with 31% to 95% CC as sociated with a plant trait as compared to a wild-type or reference plant, or the plant comprised to a wild-type or more genes CC associated with a plant trait as compared to a wild plant, or the plant CC trait as compared to a wild plant, or the plant CC are a transgenic plant comprising the polynucleotides, a computer CC readable medium having stored sequence information, and identifying a CC homologue sequence from a database comprising a plurality of known plant CC sequences comprising sequence information selected from one of CC 464 fully defined sequences given in the specification. The isolated or CC encodes a polynucleotide is used for producing a plant having a CC modified trait, the method comprising selecting a polynucleotide that CC polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexyress CC introducing the vector into a plant or a cell of a plant to overexyress CC plant, and selecting for a modified trait (e.g. increased chemicals, pest tolerance, environmental stress response (e.g. drought), microbial CC disease resistance, herbicide resistance, seed and fruit yield, growth CC rate, leaf and flower sensescence and many other traits listed in the CC encoding an A. thaliana transcription factor.

CR Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 CC Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 CC or PAP2. The genes for both PAP1 and PAP2 have been mapped to chromosome C1. PAP1 and PAP2 are MYB-like transcription factors that regulate the CC invention is useful for screening for PAP gene expression, it is also useful for detecting promoter activity within a plant cell. The CC useful for detecting promoter activity within a plant cell (e.g., A. thaliana) transformation. The transformed plant cells are then used to produce transgenic plants with tissue-specific altered colour expression. The nucleotide sequence is also useful for enhancing accumulation of phenylpropanoid product in a plant. A transgenic CC plant is useful for detecting a stress condition such as light tress, water stress, pH stress, temperature stress, heavy metal CC stress, water stress, pH stress, temperature stress, heavy metal CC stress, pathogen attack or infection, wounding, nutrient deficiency, CC clouration in ornamental plants for commercial sales, and for colouration plants to stress. Introduction of PAP1 or PAP2 sensitises CC plants to respond more quickly to a stress condition in ways that are physiologically significant, as well as in ways of ornamental CC sentence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABK14221
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated PAP1 or PAP2 gene, useful for increasing pigmentation in plants, as reporter genes for analysing expression pattern of promoter of interest, and to increase flux through phenylpropanoid pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transgenic; plant; phenylpropanoid; stress; light stress; water stress; pH stress; temperature stress; heavy metal stress; pathogen attack; infection; wounding; nutrient deficiency; herbivory; plant colouration;

The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             associated with a plant trait as compared to a wild plant. Also included associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a chomologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information. The isolated or sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide or an antisense mucleic acid, inserting the polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, most of agriculturally useful proteins or metabolic chemicals.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
